| 3/30/18 (Dr. Jon Warner) | <p>Dear Members of the Codman Shoulder Society,</p> <p>Attached please find a case presentation of my patient. Any comments or advice on this case would be greatly appreciated. Thank you in advance for your help.</p> | Case Presentation PPT |
| 4/2/18 (Dr. Peter Millett) | <p>Great case. Very challenging though. If older patient, would do scope and debridement/CAM type procedure. For over, 60 would likely do RTSA.</p> <p>In young patient like this, I have been doing distal tibia OA graft for this for about 10 years, like my partner Matt Provencher described for anterior bone loss.</p> <p>About 5 yrs ago, my fellows published a few of our early cases for instability-related posterior bone loss (see below). The bone grafts have incorporated and also have the added benefit of a cartilage bearing surface. There can be resorption over time with hardware prominence according to Wolff's law so I always tell patients the screws may need to come out after 1 yr.</p> <p>No longer use ICBG intra-articularly as I have had to revise some ICBG because of continued grinding and pain. I think there is no great solution, but putting cartilage against the head at least to me makes a little more sense.</p> <p>Have always wondered if anterior closing wedge would be an option to decrease loading and recenter humerus? I think opening wedge might lateralize too much? I know Walch has said it doesn't work so well. JP has some experience with this too as I remember some cases back in the day so maybe he can add his thoughts / experience?</p> <p>Here is our article on our use of posterior fresh osteoarticular bone grafts – as far as I know, both these cases are still 'surviving'</p> <p>Reconstruction of posterior glenoid deficiency using distal tibial osteoarticular allograft. <https://www.ncbi.nlm.nih.gov/pubmed/23114865></p> <p>Millett PJ, Schoenahl JY, Register B, Gaskill TR, van Deurzen DF, Martetschläger F.</p> | |
